LEAFLET NO. 2505

THE P-50 DORRCLONE*

The P-50 DorrClone is a newly designed wet cyclone constructed entirely of porcelain. Inside diameter is 50 mm., and the unit makes approximately a 15 micron separation on a slurry with a solids specific gravity of 2.7. Capacities vary from 7.5 GPM at a feed pressure of 7.5 psi up to 30 GPM at 80 psi.

The P-50 is ideal for dirt removal and other operations in the food processing field. The surface is smooth with no sharp interior edges. Also porcelain will not impart taste or odors to the product. Other applications include handling hot and corrosive liquids which might attack rubber lined cyclones and many special chemical processing problems.
